Online mp4 to gif converter

By Alexis Lawrence When you download MP4 files from paid download sites, such as iTunes, those MP4s are DRM-protected. DRM is a safeguard placed in files to protect against the illegal download and sharing of copyrighted music, but this protection also makes it difficult for people who have paid for and legally downloaded the music to utilize the files anywhere other than on their computer, including on portable media devices such as MP3 players and cell phones. If you want to make the files usable in these devices, you will have to get past the copy-protection. Create a playlist of the protected songs that you would like to convert. iTunes allows the burning of protected MP4s to disc. If the playlist is longer than 74 minutes, which is the time limit on CD-Rs, iTunes will give you the option to burn the playlist onto more than one disc. Highlight the playlist. This will make the "Burn Disc" button visible at the top of the screen. Click the "Burn Disc" button. Insert a blank disc into your computer's CD drive. When you click the "Burn Disc" button, iTunes will automatically prompt you to insert a disc. Click the "Burn Disc" button again. The iTunes player will prompt you with a pop-up message that says to click the button again to burn the files to disc. A progress bar will appear at the top of the screen and show the status of the disc-burning. It will also show the estimated time remaining. When the disc is done writing, leave the disc in the computer. Download the CD Master CD-ripping software (see Resources). Follow the prompts to install CD Master to your computer. Open CD Master and wait for the software to recognize the CD in your computer drive. This may take a minute or two. If CD Master doesn't recognize the CD, eject the disc and insert it again. Go to the "Record" menu and select "CD Ripper" from the menu options. Select the output file type and output folder of your choice. CD Master can convert protected MP4s into WAV, OGG or MP3 files. To choose an output folder, click on the "Destination Directory" button next to your chosen file type of WAV, OGG or MP3. You will be able to browse your system for the folder where you would like to save the files. Use the "Move all" arrow to transfer all of the files on the CD from the "Available Tracks" list to the "Tracks to Process" list. This will move all of the audio files on the CD to the list to be converted. Click "OK" and the conversion process will begin. Progress will be monitored on the CD Master screen. Once the conversion is complete, the unprotected WAV, OGG or MP3 files will be available in the folder you chose for file output. We live in a world where we want every movie and TV show to be available at our fingertips on every electronic device in our arsenal. Shelves chock-full of movies now seem overly cumbersome, and they're also an unnecessary waste of space that can be better used for something else. On top of that, we all know how boring a flight or train ride can be without access to a robust library of entertainment. There's more than one way to convert your spinning movie discs to a format that's compatible with a range of devices, and here to help out is our guide on how to convert a DVD to MP4. The process is easy whether you're using the latest version of Windows or MacOS Mojave. Keep in mind, though, that reproducing copyrighted material is illegal. Movavi Video Converter Daniel Martin/Screenshot Step 1: Head over to the main Movavi conversion page and click the blue Download for Free button for your operating system, making sure to select the correct OS. Then, open the installer and follow the on-screen instructions. (Depending on your system, you may see a prompt telling you to download the 64-bit version of the installer instead. Go ahead and do that if you have a 64-bit system.) A new installer will download, and you'll follow the on-screen instructions. Launch the application once installed. Note: This software is only for the seven-day free trial version. Step 2: Once open, click on the + Add Media button at the top of the window. Then, select Add DVD > Open DVD. Select your disc drive, navigate to the VIDEO_TS folder, and choose Select Folder. Step 3: Click on the cog next to Output Format at the bottom of the window for a list of customizable presets. Select MP4 (*.mp4) from the list of available formats. You can also click on the Video tab at the bottom of your screen and then choose your desired MP4 preset. Then, click Save To: and navigate to your desired save location for the resulting file. Click the Convert button in the lower-right corner to start the conversion process. Note: The Movavi converter method does not work on copy-protected DVDs. DVDVideoSoft Free Video Converter Step 1: Head over to the DVDVideoSoft website and select Download to download the free software. Once the download is complete, launch the converter. It's very easy to use — everything you need is in a single window. Start with the top bar that says Input DVD, and choose your DVD file by selecting the right drive to search and hitting Browse. screenshot Step 2: This software has the ability to identify any title that's associated with the DVD file. Select Choose beneath the Title # heading to view the available languages and titles. When you've made your selection on the desired title, you can click OK to finalize and save the information. Click Browse beneath Output Folder to select the location where you want to save your converted file once finished. screenshot Step 3: Next, take a look at the section for Formats and Presets. This section allows you to pick the format (MP4) and then choose a preset if you want, optimizing the MP4 file for specific devices. This option is especially advantageous if you have a set device for playing the file in question. The app is ideal for Mac or Apple device users. It's as if the DVDVideoSoft converter designed the app for iOS and macOS because video conversion on these systems is especially high-quality. All that is left to do is to click on the Convert button, and the app will take care of the rest. Note: If a DVD is labeled as copy-protected, the DVDVideoSoft converter will not be able to convert it. Editors' Recommendations While it's not as popular as MOV or even FLAC files, you might occasionally encounter an MKV, or Matroska, file. When you're dealing with subtitles on an audio or video track, an MKV file can come in handy. When it's time to convert an MKV file into something your device will support, like an MP4 file, it's important to make sure you follow these steps to prevent any data loss. VLC (Windows/MacOS) The VLC media player can recognize and play almost any video format, including MKV. Better yet, it can also convert them to something more universal, like MP4. Here's how. Step 1: Head over to VideoLAN's website and download VLC. Make sure to read the fine print when installing, so you aren't introducing your computer to any bloatware. Step 2: Open the software and click the Media tab in the upper-left corner and select Convert/Save from the resulting drop-down menu. Step 3: Click the Add button and locate the file you wish to convert on your PC. Once it's selected, press the Convert/Save button at the bottom of the window. Step 4: Specify your desired video format — in this case, we'd recommend H.264 + Mp3 (MP4) — using the drop-down menu beside Profile. Clicking the tool icon (next to the drop-down menu) will also allow you to further fine-tune your settings. Step 5: Specify under Destination where you would like VLC to export your file. Then, click Start. The timeline will turn into a progress bar and once it finishes, your video will be ready. Remember that the old MKV file still exists. If you no longer want the old file and would prefer more storage space on your computer, you should delete all your old MKV files when finished. CloudConvert (web-based) screenshot Fortunately, you don't have to rely on software to convert your files. Instead, you can use a web service to do the work for you. There are plenty to choose from, but we think CloudConvert is the best. It's simple and supports a wide variety of file formats. It's a hosted service, so you'll have to upload your video files to their server. You may have privacy concerns, and if you do, you can simply use software to edit them on your own device. Otherwise, you have the choice to immediately delete your file as soon as it converts. Just click on the X icon next to the Download button to do so. Be warned that it can take up to 24 hours, but your videos should be deleted from their servers permanently. Step 1: Go to the CloudConvert homepage and click Select File to choose a file from your computer. If you click on the drop-down arrow within the Select File button, you can choose from files you keep in Google Drive, Dropbox, or other online storage options. Step 2: Select the arrow next to Convert To and then choose MP4 from the video formats list. Click the Convert button to start the process. Screenshot Step 3: The conversion doesn't take too long, and you know the process is done when the option to download appears. (CloudConvert may automatically playback your newly converted video for you, so that you can see if the conversion went well before you download the new file.) Click the green Download button to download your new video. Once you download your MP4 file, you can use it on any compatible device or platform. If you're going to convert files frequently, you might want to add the CloudConvert Chrome extension. screenshot Editors' Recommendations What should you do when you don't need to watch a video, but instead just need to listen to the audio? In these cases, you want the portability and storage offered in an MP3. We are going to show you how to easily convert an MP4 video file to an MP3. There are a variety of free file converters you can use directly in your browser or download to your desktop. Read on to learn about our favorites and our simple instructions on how to convert your MP4 files using these free tools. Step 1: Navigate to CloudConvert The CloudConvert homepage is the best place to start. CloudConvert is an intuitive, cloud-based service that provides a stand-alone option that requires little more than an internet connection and your file. It's entirely free, requires no additional software to run, and supports more than 200 formats — most importantly in our case, MP4 to MP3. While the resulting audio quality is great, as is the conversion speed, a free account only allows up to 25 free conversions per day. However, CloudConvert should suit your needs if your only need to convert a few, small files per day. Step 2: Select the files you want to convert screenshot Click the Select File button in the middle of the page and select the video files you wish to convert to MP3. A pop-up window will appear where you can locate or search for the desired files on your computer. If you click on the Drop Down Arrow icon to the right of Select File, you can also choose a file from a URL or from your Dropbox, Google Drive, or OneDrive. Note that you'll need to sign in to your cloud storage account via the CloudConvert site to access your cloud storage files. Doing so may automatically create a free CloudConvert account. Once your files are selected, click the Open button in the lower-right corner of the pop-up window to add your files to the conversion queue. Step 3: Choose your output format screenshot Click the Drop Down Arrow button that appears after uploading your MP4 file, then select Audio followed by MP3 from the drop-down list. Click the Wrench icon located directly beside the file if you wish to fine-tune the audio bit rate, audio Qscale, volume, or length. The latter is an incredibly handy tool if your video has an introduction or ending with undesired audio. When finished, click the red Okay button. Step 4: Begin the conversion screenshot Click the red Convert button on the right side of the page when you've finished setting your desired output preferences. A gray-and-yellow bar will appear indicating the conversion's current status, along with a cancellation button (a red X next to the gray-and-yellow bar) should you change your mind for whatever reason. Afterward, wait for the conversion to complete. Step 5: Download your new MP3 screenshot It may take some time, but CloudConvert will notify you when your conversion is finished. (A preview of your MP3 track may automatically play so you can hear it before deciding to download it.) Then just click the green Download button to save it to your computer. Now that you ripped your audio, you need a decent MP3 player to play it on. These are our favorites. Alternative: Any Video Converter (Windows and MacOS) You can use our favorite video converter, Any Video Converter, if you want to convert files on your computer. By using this converter, users can convert MP4 audio into a variety of formats, including the highly portable MP3 format. This converter is our top choice due to its high speeds, good video and audio quality, and its wide range of supported devices. AVC also offers advanced options, including cropping and trimming audio files or layering different files. The AVC website offers a free edition of the Any Video Converter software that you can download directly. You can start the download process with a simple click of the Download button. After the installation, open the app and click the Add or Drag File(s) button on the screen. screenshot A pop-up window will appear where you can select the MP4 file as the input. Then you will select MP3 as the output type from the options provided in the Drop Down Menu to the left of the Convert Now! button. Click on the Music Note icon in this menu to see the available audio options. Then select MP3. The conversion will begin when you click the Convert Now! button. Your new MP3 file's save location will automatically open after the conversion is finished so you can locate your new file on your device right away. Editors' Recommendations Video formats can be confusing, and some might not work in your video player of choice, especially more obscure formats like MKV. It's often easier or even necessary to convert them to something more usable, like MP4. Luckily, that conversion is easy to do. Note: We're using macOS for our examples and screenshots in this article, but all the apps we're using here work pretty much identically on Windows. What are MKV Files, and Why Should I Convert Them? MKV is not a video format. Instead, it's a multimedia container format used to combine different elements like audio, video, and subtitles into a single file. That means you could use any video encoding you want in an MKV file, and still have it play. RELATED: What Is an MKV File and How Do You Play Them? The problem arises with compatibility. Not every device or video app can play MKV files, and that's especially true on mobile devices. MKV is open source, and not an industry standard, so it doesn't have support on many devices. It won't even work in Windows Media Player or Quicktime, the defaults for Windows and macOS. The solution: Convert your MKV files to MP4. MP4 is compatible with most devices and apps, and you won't lose much quality (if any) to the conversion process. The Simplest Solution: Use VLC VLC is an open source media player, one of the few that can play MKV, but it also has a hidden option for converting video. From the "File" menu (or "Media" menu on Windows) choose the "Convert / Stream" option (or "Convert / Save" on Windows). This doesn't automatically convert what you're watching, so you'll have to drag the file into the window again. Afterward, you can choose the file format you want to use for saving; VLC supports most formats, but MP4 is the default. After selecting the format you want, just hit the "Save" button and select where you want to save the new file. A More Full-Featured Solution: WinX Video Converter While VLC performs a simple encode on a single file, there's a lot more under the hood that you might want to control if you're doing any video production work. For this, WinX VideoProc handles the job well. When you open it up, switch to the "Video" tab at the bottom, and the first screen you see asks you to drag media onto it. Drag your file in, and the rest of the controls will pop up. You can also add entire folders of videos and bulk encode them all at once, but we'll stick to a single video for now. Again, the default conversion option is MP4, so we don't have to change much there, but if you want to take a peek under the hood, you can double-click the profile to change the settings. From here you can change many options, the notable ones being: Image quality, to adjust the quality in each frame, and the encoding speed Bitrate, to make files smaller at the cost of quality Framerate, to convert down to 30 or 24fps video Resolution and aspect ratio There are also audio codec options, but audio makes up such a small part of the video it's worth keeping it on high settings. Once you're done configuring, you can hit "Run" to start the conversion. Video conversion can take a while, especially with larger videos, but when it's done the app will automatically open up the folder where it saved your files. Open Source Alternatives WinX is shareware, and while you can do a lot of things with the trial version, the full app is locked down unless you pay for the premium version. If you want the same level of customization for free, it's worth trying Handbrake. Handbrake is a little more streamlined, but its interface can be a bit confusing. With so many options and buttons, it's a little hard to figure out which one does what, but the basic ones you need to know are the presets (which affect the quality and encoding speed) and the format (which defaults to MP4 like the others). Handbrake has a nice queue for lining up multiple encodes but doesn't have the same option to encode entire folders as WinX does. However, you can add multiple files individually, and then add them all to the queue. It's still useful though since encoding very large files can sometimes take hours depending on your computer's specs. Image Credits: Halay Alex/Shutterstock
