Algorithm is a very big topic and very difficult to understand and many problem were came if you doneAAÄ know the basic concept of Algorithms? Many sorting algorithms exist, each of which has its own advantages and downsides. What is Algorithm? Although there are numerous sorts of algorithms, the key categories of IT algorithms include: Divide and conquer algorithmsA : Divide the issue into smaller sub-issues of the same type; solve smaller issues and integrate the original problem solving answers.Bru force algorithms : Try every potential solution until the solution is found satisfactory.Randomized algorithmsA : To find a solution to the problem, employ a random integer for at least once throughout a calculation.Greedy algorithms : Finish at local level an ideal solution to discover the ideal answer to the complete issue.Recursive algorithms : Address the lowest and easiest form of an issue and solve it in a wider and broader way until the original problem has been resolved.Backtracking algorithms : Divide the issue into sub-problems that can be resolved, but if the required answer is not attained, reverse the problem under a route pushes it forward is established.Dynamic programming algorithms : Parse a difficult problem and solve them once only, instead of re-calculating their answers, by collecting smaller subproblems and saving their solutions for future use. What are the Disadvantages of Algorithms? Rep until the original list is depicted.Bubble sort:- Compare the first two items in the list and swap them if the first .detnemelpeipm ,dethemelpeipm ,Dethemelpeipm .Scretof elbaima eht ihem eh \ "A Ä A ä" ,~ä e ä A Ä "Denifed LLeW .definations yletaquaeda eb diuhs stupni eht ,stupni ekat of uhew · nt · lef sto Dluo SuoNeG
