Properties of the Real Numbers

Closure Inverse -x, 1/xIdentity 0, 1 Associative (x + y) + z = x + (y + z) (x * y) * z = x * (y * z)Commutative x + y = y + x x * y = y * xDistributive x*(y+z) = x*y + x*z

Html form properties. Html form element properties. Html form input properties. Html form attributes properties. Html form properties javascript. Html form button properties.

All implemented interfaces: Serializable, Clonable, Map Direct Known Subclasses: Provider public class Properties can be saved in a sequence or loaded from a sequence. Each key and its corresponding value in the properties can be saved in a sequence or loaded from a sequence. can contain another list of properties such as their \\\"default values\\\"; This second list of properties in herits from Hashtable, the put and putAll methods can be applied to a Properties object. Their use is strongly discouraged, as they allow the caller to insert entries whose keys or values are not Strings. Instead, the setProperty method should be used. If the store or save method is called on a \\\"compromised\\\\" Properties object that contains a key or value that is not String, the call will fail. Similarly, the call to the property Method will fail if a \\\"compromised\\\\\" Properties object that contains a non-String key is called. The load(Reader) \\\/ store(Writer, String) methods load and store properties to and from a character-based sequence in a simple line-oriented format specified below. The load(Reader) \\\/ store(Writer, String) pair, except that the input\\\output stream is encoded in the ISO 8859-1 character encoding. Character stat cannot be represented directly in this encoding can be written using Unicode escapes as defined in section 3.3 of the Java Language Specification, only a single 'u' character is allowed in an escape sequence. The native 2 ascii tool can be used to convert property files to and from other character encodings. The loadFromXML(InputStream) and storeToXML(OutputStream) and storeToXML(OutputStream) and storeToXML(InputStream) and storeT declaration: Note that the system URI (http:\\\\\)java.sun.com\\\/dtd\\\/properties.dtd) is not accessed when exporting or importing properties; it simply serves as a string to uniquely identify the DTD, which is: This class is thread-safe: multiple threads can share a single Properties object without the need for external synchronization. From: JDK1.0 See also:native2ascii tool for Solaris, native2ascii tool for Windows, serialized Form clear, clone, contains, contains, contains, contains, contains, petclass, notify, notifyAll, wait, wait protected Properties Defaults A list of properties that contains default values for any key not in this list of properties. Properties (Properties an empty property list with no default values. Parameters: Default values. Parameters: Default values. Properties (Properties defaults) Creates an empty property list with the specified default values. Hashtable put method. Parallelism is provided with the getProperty method. Applies the use of strings for keys and property values. The return value is the result of the key. Returns: The previous value of the key specified in this list. of properties, or null if you did not have one. From: 1.2 See also:getProperty(java.lang.String) public void load(Reader reader) throws IOException Reads a list of properties are processed in terms of lines. There are two types of line, natural lines and logical lines. A natural line is defined as a line of characters that ends by a line ending character set (or \\\\r or \\\\\r) or at the end of the sequence. A natural line can be blank line, a comment line or contain all or part of a key-element pair, which can be extended across several adjacent natural lines escaping the line terminator sequence with a backslash character \\\\. Note that a comment should have its own comment indicator, as described below. The lines are read from the entrance until the end of the sequence is reached. A natural line that contains only white space characters is considered blank and ignored. A comment line has an ASCII '#' or '!' as its first spatial character; comment lines are also ignored and do not encode key element information. In addition to line terminators, this format considers the characterspace ('', '\\\\u00000'), tab ('\\\\tau', '\\\u00000') and form font ('\\\\f', '\\\u00000') to be blank spaces. If a logical line extends across multiple natural lines, the backslash that escapes the line terminator sequence, and any blank space at the beginning of the next line do not affect the key or element values. The rest of the discussion about analyzing keys and elements (when loading) will assume that all the characters that make up the key and element appear on a single natural line after the line continuation characters have been removed. Note that it is not sufficient to examine only the character that precedes a line terminator; there must be an odd number of continuous backslashes for the line terminator to escape. Since the input is processed from left to right, a non-zero even number of contiguous backslashes of 2n before a line terminator (or elsewhere) encodes n backslashes after exhaust processing. The key contains all characters on the line that begin with the first non-whitespace character and until, but not including, the first unlimited character '=', ':', or white space character other than a line terminator. All of these key ending characters can be included in the key by escaping them with a previous backslash character key \\\":=\\\". Line terminator characters can be included using \\\\r and escape sequences. Any blank space after omitting the key; if the first non-whitespace characters after it are also ignored and the whitespace characters on the line become part of the associated element string; if there are no characters remaining, the item is the empty string \\\"\\\". Once the raw characters sequences that make up the key and item are identified, escape processing is performed as described above. As an example, the following three lines specifies the key \\\"Truth\\\" and the value of the associated element \\\"Beauty Truth:Beauty Truth:Be property: fruits apple, banana, pear, \\\\ melon, watermelon, kiwi, mango\\\" Note that a space appears before each \\\\ and the initial white space of the 3.3 and 3.10.6 of the Java language specification™). The differences with character sequence with character sequences and Unicode escapes are not recognized. The method does not handle a backslash character, with character sequences with the sequences with the sequences with the sequence with the sequences with the sequences with the sequences wit character as an error; the backslash is silently dropped. For example, in a Java string, the sequence \\\"\\\b\\\" as equivalent to the unique character \\\"b\\\\". Exhausts are not required for single and double quotation marks; however, according to the previous rule, single and double quotation mark characters preceded by a backslash still produce single and double quotation mark characters, respectively. Only a single 'u' character is allowed in a joined escape sequence. The specified sequence remains open after this method returns. Parameters:reader: The flow of input characters. Launch: IOException - if an error occurred while reading from the input stream in the entry. From: 1.6 public void load(InputStream in Stream) throws IOException Lee a list of properties (key pairs and elements) of the input byte stream. The input stream is in a simple line-oriented format as specified in load(Reader) and is assumed to use ISO 8859-1 characters, are represented in keys and elements using Unicode escapes as defined in section 3.3 of the Java Language Specification™. The specified sequence remains open after this method returns. Parameters:inStream - the input stream. IllegalArgumentException: If the input stream out, String comments) Obsolete. This method does not generate an IOException if an I\\\O error occurs while saving the list of properties. The preferred way to save a list of properties is through the store(OutputStream out, String comments) method or the store(OutputStream out, String comments) method of the store(OutputStream out, String comments) method of the store(OutputStream out, String comments) m comments) method and suppresses the IOExceptions that occurred. Parameters:out - an output flow.comments - a description of the list of properties (key pairs and items) in this Properties table in the output character sequence in a format suitable for using the load(Reader) method. The properties table in the output character, the comment string, and a line separator are first written to the output stream. Therefore, comments can serve as an identifying comment. Any of a line feed (''), a carriage return ('\\\r') or a carriage return immediately followed by a line feed in the comments is replaced by a line separator generated by the Writer and if the next character in the comments is not the # character or character! then an ASCII NUMBER is written after that line separator. Next, a comment line is always written, consisting of an ASCII # character, the current time), and a line separator generated by the Writer. Then each entry in this properties table is written, one per line. For each entry the key string is written, then an ASCII =, then the associated element string. For the key, all space characters are written with an earlier \\\\ characters are written with an earlier \\\\ characters and element #, !, =, and : are written with a previous backslash to ensure that they load correctly. Once the inputs are written, the output stream remains open after this method returns. Parameters: writer - a flow of output stream remains open after this method returns. Parameters: writer - a flow of output stream remains open after this method returns. results in an IOException. ClassCastException: Whether this Properties object contains keys or values that are not String comments) throws IOException Write this list of properties (key pairs and items) in this Properties table in the output stream in a format suitable for loading into a Properties table using the load(InputStream) method. The properties of the default table in this Properties table (if any) are not written using the load(InputStream) method. The properties of the default table in this Properties table (if any) are not written using the load(InputStream) method. The properties of the default table in this Properties table (if any) are not written using the load(InputStream) method. The properties of the default table in this Properties table (if any) are not written using the load(InputStream) method. The properties of the default table in this Properties table (if any) are not written using the load(InputStream) method. The properties table (if any) are not written using the load(InputStream) method in the load (InputStream) method (InputSt inputs are written, the output flow is emptied. The output stream remains open after this method returns, Parameters; out - an output flow, comments - a description of the list of properties. Throws: IOException: Whether this Properties object contains keys or values that are not Strings. NullPointerException - if it comes out it is null. Because: 1.2 public void loadFromXML(InputStream in) throws IOException, InvalidPropertiesFormatException Loads all properties represented by the XML document must have the following DOCTYPE declaration: In addition, the document must satisfy the DTD properties described above. The specified sequence closes after this method returns. Parameters: in - the input stream from which it is to read the XML document. Launches: IOException; if the reading of the specified input stream results in an IOException. InvalidPropertiesFormatException: The input stream data does not constitute a valid XML document type. NullPointerException - if in es null. From: 1.5 See also:storeToXML(OutputStream, String) public void storeToXML(OutputStream os, String comment) throws IOException Issues an XML document that represents all the properties contained in in table. An invocation of this method of the form props.storeToXML(os, comment) behaves in exactly the same way as the invocation props.storeToXML(os, comment, \\\"UTF-8\\
