In this tutorial, I will show you how to implement Angular 12 Form Validation example (and Submit) with Reactive Forms Module and Bootstrap 4. More Practice: - Angular 12 Template Driven Forms Validation example - Angular File upload example with progress bar - Angular CRUD Application example with Web API - Angular JWT Authentication example with Web ApiServerless with Firebase: - Angular Firebase CRUD Realtime DB | Angular FirebaseDatabase - Angular Firestore CRUD example | Angular Firestore - Angular File Upload Firebase Storage: Display/Delete Files exampleNewer version: Angular 13 Form Validation example (Reactive Forms)Overview of Angular 12 Form Validation exampleWe will implement validation for a Angular Form using Reactive Forms Module and Bootstrap. The form has:Full Name: requiredUsername: required, from 6 to 20 charactersEmail: required, email formatPassword: required, from 6 to 40 charactersConfirm Password: required, same as PasswordAccept Terms Checkbox: requiredSome fields could be wrong: Successful Submission will look like this:TechnologyWe're gonna use following modules:Angular 12Bootstrap 4@angular/forms 12Setup ProjectFirst we need to add the ReactiveFormsModule into our App Module.Open src/app/app.module.ts and import ReactiveFormsModule from @angular/forms:import { NgModule } from '@angular/core'; import { BrowserModule } from '@angular/platform-browser'; import { ReactiveFormsModule } from '@angular/forms'; import { AppComponent } from './app.component'; @NgModule({ declarations: [AppComponent], imports: [BrowserModule, ReactiveFormsModule], providers: [], bootstrap: [AppComponent] }) export class AppModule { } Import Bootstrap 4Open src/index.html and add following line to tag: ... Form Validation with Angular 12 Reactive FormsThe app component contains Form Validation example built with the @angular/forms version 12.Open app/app.component.ts, we're gonna import necessary library first:import { Component, OnInit } from '@angular/core'; import { AbstractControl, FormBuilder, FormGroup, Validators } from '@angular/forms'; import Validation from './utils/validation'; We use Angular FormBuilder to create a FormGroup object (form property) which is then bound to the template element (using the [formGroup] directive later).Validators provides a set of built-in validators (required, minLength, maxLength...) that can be used by form controls.A validator is a function that processes a FormControl or collection of controls and returns an error map or null (meaning validation has passed). Validation is our custom class that provides custom validator function. I will explain it later.export class AppComponent implements OnInit { form: FormGroup; submitted = false; constructor(private fb: FormBuilder) { ngOnInit(): void { this.form = this.fb.group({ fullname: ['', Validators.required], username: ['', [Validators.required, Validators.minLength(6), Validators.maxLength(20)]], email: ['', [Validators.required, Validators.email]], password: ['', [Validators.required, Validators.minLength(6), Validators.maxLength(40)]], confirmPassword: ['', Validators.required], acceptTerms: [false, Validators.requiredTrue] }, { validators: [Validation.match('password', 'confirmPassword')] }); } ... } We also have getter f to access form controls (form.controls) from the template. For example, we can get username field in the template using f.username instead of form.controls.username.The submitted property helps us to check whether the form is submitted or not.export class AppComponent implements OnInit { form: FormGroup; submitted = false; constructor(private fb: FormBuilder) { ngOnInit(): void { ... } get f(): { [key: string]: AbstractControl } { return this.form.controls; } onSubmit(): void { this.submitted = true; if (this.form.invalid) { return; } console.log(JSON.stringify(this.form.value, null, 2)); } onReset(): void { this.submitted = false; this.form.reset(); } } Angular 12 Form Validation templateNow we create the form with input fields and validation messages.We bind to the FormGroup object (form) in the app component using [formGroup] directive. Form submit event will call onSubmit() handler above using event binding (ngSubmit).Validation messages will display after form submission for the first time by submitted property.app.component.html Full Name Fullname is required Username Username is required Username must be at least 6 characters Email Email is required Email is invalid Password Password is required Password must be at least 6 characters Confirm Password Confirm Password is required Confirm Password does not match I have read and agree to the Terms Accept Terms is required Register Reset Confirm Password validation in Angular 12Now we will use Angular Custom Validator to implement password and confirm password validation... First, the validator returns null (meaning validation has passed) if there is any error on the control that we want to check (confirm password). - Then, the validator checks that two fields match or not and set error on checking control if validation fails.import { AbstractControl, ValidatorFn } from '@angular/forms'; export default class Validation { static match(controlName: string, checkControlName: string): ValidatorFn { return (controls: AbstractControl) => { const control = controls.get(controlName); const checkControl = controls.get(checkControlName); if (checkControl.errors && !checkControl.errors.matching) { return null; } if (control.value !== checkControl.value) { controls.get(checkControlName).setErrors({ matching: true }); return { matching: true; } } else { return null; } }; } } Run Angular 12 Form Validation AppYou can run our App with command: npm start. If the process is successful, open Browser with Url: and check it.Or run on Stackblitz:ConclusionToday we've built Angular 12 Form Validation example successfully with Reactive Forms Module & Bootstrap 4.You can also use the Form Validation in following posts: - Angular File upload example with progress bar - Angular CRUD Application example with Web API - Angular JWT Authentication example with Web ApiOr use Template Driven Forms instead: Angular 12 Template Driven Forms Validation exampleHappy learning! See you again.Further ReadingIntroduction to Angular FormAngular Reactive FormsServerless with Firebase: - Angular Firebase CRUD Realtime DB | Angular FirebaseDatabase - Angular Firestore CRUD example | Angular Firestore - Angular File Upload Firebase Storage: Display/Delete Files exampleFullstack CRUD Application: - Angular + Node.js Express + MySQL example - Angular + Node.js Express + PostgreSQL example - Angular + Node.js Express + MongoDB example - Angular + Spring Boot + H2 example - Angular + Spring Boot + MySQL example - Angular + Spring Boot + PostgreSQL example - Angular + Spring Boot + MongoDB example - Angular + Django example - Angular + Django + MySQL example - Angular + Django + PostgreSQL example - Angular + Django + MongoDB example

16/07/2020 · Breakdown of the Angular 10 Alert Module Code. Below is a breakdown of the pieces of code used to implement the alerts example in Angular 10, you don't need to know all the details of how it works to use the alert module in your project, it's only if you're interested in the nuts and bolts or want to modify the code or behaviour. 27/05/2021 · Step 4: Add the following code to add validation code at component level in your app.component.ts file as shown below:import { Component, OnInit } from '@angular/core'; import { FormGroup, FormControl, Validators } from '@angular/forms'; 09/08/2017 · For both examples in this tutorial we will use Angular Material as our UI library. I've covered how to setup an Angular project with Angular Material in this post.. Example 1: Using *ngIf to "hide" the NavBar. In this first example we will have only one page layout and we will verify if the user is logged in and use *ngIf to verify if the application should display the navigation ... 21/06/2022 · In this tutorial, I will show you how to implement React Form Validation and Submit example using Formik, Yup and Bootstrap 4. More Practice: - React.js CRUD example with Rest API - React File Upload with Axios and Progress Bar to Rest API - React JWT Authentication (without Redux) example - React Redux: JWT Authentication example ... 04/06/2022 · This Angular post is compatible with Angular 4 upto latest versions, Angular 7, Angular 8, Angular 9, Angular 10, Angular 11, Angular 12 and Angular 13. One of a package is @ng-select in our top list to convert traditional HTML select form control into an advanced selection component with many features: 31/07/2018 · I am using angular 6 and I have been searching on best way to match password and confirm password. This can also be used to match any two inputs in a form. I used Angular Directives. I have been wanting to use them . ng d compare-validators --spec false and i will be added in your module. Below is the directive 16/07/2020 · Breakdown of the Angular 10 Alert Module Code. Below is a breakdown of the pieces of code used to implement the alerts example in Angular 10, you don't need to know all the details of how it works to use the alert module in your project, it's only if you're interested in the nuts and bolts or want to modify the code or behaviour. 12/07/2020 · Example built with Angular 10.0.3 and Reactive Forms. Other versions available: Angular Template-Driven Forms: Angular 10 Next.js: Next.js React + Formik: Formik 2 React Hook Form: React Hook Form 7, 6 Vue + VeeValidate: Vue 3 Composition API, Vue 3 Options API This is a quick example of how to implement a required checkbox field in Angular with Reactive Forms. 31/07/2018 · I am using angular 6 and I have been searching on best way to match password and confirm password.
