## Horizontal stretch function

Horizontal stretch square root function. Horizontal stretch exponential function. Which of the following is a horizontal stretch of the parent function. Which of the following is a horizontal stretch of the same parent function. Horizontal stretch absolute value function. Which function would be produced by a horizontal stretch. Horizontal stretch quadratic function. Horizontal stretch log function.

Learning gets graph functions using compressions and stretches. Adding a constant to the inputs or outputs of a function changed the position of a graph relative to the axes, but did not affect the shape of a graph. Now let's explore the effects of multiplying inputs or outputs by a certain amount. We can transform the inside (input values) of a function or we can transform the outside (output values) of a function. Each change has a specific effect that can be seen graphically. Vertical bars and compressors When you multiply a function by a positive constant, you get a function whose graph is stretched or compressed vertically relative to the graph of the original function. If the constant is greater than 1, we get a vertical stretch; if the constant is between 0 and 1, we get a vertical compression. The following graph shows a function multiplied by constant factors 2 and 0.5 and the resulting vertical stroke and compression. Vertical tension and compression Given a function  $[f(x)]$ , a new function  $[g(x) = af(x)]$ , where  $a$  is constant, is either a vertical stretch or a vertical compression of the function  $f(x)$ . If  $a > 1$ , the graph will be stretched. If  $0 < a < 1$ , the graph will be compressed. If  $a > 1$ , the graph is stretched by a factor of  $a$ . If the graph is compressed by a factor of  $a$ . If  $a < 0$ .
